

WATER QUALITY SAMPLING

A Cross-Platform Compatibility application with automated staff scheduling and Chain of Custody management developed by JENESYS improvised the sampling procedure and record management

THE CUSTOMER

The customer is a government water utility board of a state in the US. The state requires the customer to implement programs to meet the federal norms and regulations of water standards.

The customer is responsible for maintaining the drinking water quality of the City by carrying out regular and special runs for water quality checks and disinfection monitoring. The program consists of monitoring, inspection, and testing of water bodies and water systems that are connected to the public water systems.

BUSINESS CASE

The existing process was performed manually. The limitations of the application include:

- Legacy System was Developed 15+ years back.
- Not user-friendly – No significant usage of the system by the Water Quality Division (WQD) staff.
- Manual Staff Scheduling Updates – run creation, scheduling, and assignments.
- Static Data – There is no easy way to find and update data with the changes needed over time.
- Any update needs to be done in multiple edits, and there is no provision to track the changes and updates.
- MIS reports was not present legacy application.

Hence, the customer wanted to develop a web-based application for scheduling runs, sample collection, Chain Of Custody (COC) and better tracking and management of water quality sampling.

JENESYS SOLUTION

Jenesys developed a role-based web application that automated the business process of the water quality department. The business process includes

WATER QUALITY SAMPLING

The application features include

[REDACTED]

Technologies used:

[REDACTED]

HOW DID THE SOLUTION BENEFIT?

- The automated process avoided manual intervention that created human errors and reduce paper work.
- COC proved to be efficient in tracking the run and relinquishments.
- Dynamic Report generation helped to generate the reports for the selected data.
- Values of Disinfection monitoring that required round the clock monitoring was efficiently captured and tracked.
- Auto scheduling reduced the manual checking of availability of employees and their workload.
- Streamlined the complete process of sample collection in the [REDACTED].
- Automated Data integration to LIMS.

WHAT'S NEXT?

[REDACTED] enhancing the application to improvise the functionalities associated with the sampling procedures, vehicle management, direction routing, more analytical report and maintenance for the application is provided.
